

Resolution 20/XXII
Ice-strengthening standards in high-latitude fisheries¹

Species	all
Area	south of 60°S
Season	all
Gear	all

The Commission

Recognising the unique circumstances in high-latitude fisheries, especially the extensive ice coverage which can pose a risk to fishing vessels operating in those fisheries,

Recognising also that the safety of fishing vessels, crew and CCAMLR scientific observers is a significant concern of all Members,

Further recognising the difficulties of search and rescue response in high-latitude fisheries,

Concerned that collisions with ice could result in oil spills and other adverse consequences for Antarctic marine living resources and the pristine Antarctic environment,

Considering that vessels fishing in high-latitude fisheries should be suitable for ice conditions,

urges Members to licence to fish in high-latitude fisheries only those of their flag vessels with a minimum ice classification standard of ICE-1C² which will remain current for the duration of the planned fishing activity.

¹ Subareas and divisions south of 60°S and adjacent to the Antarctic continent

² As defined in the Det Norske Veritas (DNV) Rules for Classification of Ships or an equivalent standard of certification as defined by a recognised classification authority.
